1. PROJECT TITLE

Development of an Interactive Product Catalog Website

2. PROBLEM STATEMENT

Many businesses still rely on static web pages, social media posts, or manual catalogs to display their products. These approaches lack interactivity and make it difficult for customers to quickly find specific products. Customers are often forced to scroll through long lists without the ability to search, filter, or compare products. This results in poor user experience, wasted time, and reduced customer satisfaction.

Additionally, businesses face challenges in updating product information consistently, leading to outdated prices, descriptions, or availability. The absence of an interactive system limits both customer engagement and business visibility in the digital market.

3. GENERAL OBJECTIVE

The main objective of this project is to design and develop an interactive product catalog website that allows users to easily browse, search, and filter products, while enabling businesses to efficiently manage and update product information through a web-based platform.

4. SPECIFIC OBJECTIVES

- i. To develop a user management system for registering and logging in users.
- ii. To implement search functionality that enables users to quickly find products by name or category.
- iii. To develop an admin module that allows easy addition, updating, and removal of product data.
- iv. To develop a page for detailed product information including images, descriptions, and prices.
- v. To develop a shopping cart for storing list of products selected by a user for purchase.

5. SYSTEM DESIGN

5.1. ENTITIES

- i. Customer - The clients to select products from the product catalogue.
- ii. Product – The goods to be purchased by customers.
- iii. Shopping cart – A list of selected products of specified amounts of products to be purchased by a specific customer.
- iv. Admin – A super-user that adds, deletes and updates products in the system.

5.2. ENTRY- RELATION DIAGRAM
